

Internal evolution changelog

One-page project map - informal phases, model lineage and current operating rules

CURRENT

Phase 3.7 - decision-aware learning

Commit 337926b - 14 Jul 2026

ROADMAP

Informal phases & checkpoints

V1.0

Before Industry Feature

MVP watchlist, Dashboard, Company, Journal, yfinance prices, FMP fundamentals and transparent absolute scores.

V2.0

Before Trading

Portfolio became a first-class page: dated lots, cost basis, P&L, FX, cash/dividends, benchmarks, allocation, targets and backups.

3 / 3.1

Industry + UX foundations

Peer cohorts, analyst context and responsive Decision Dashboard / Company / Portfolio redesign; automatic background completion.

3.2

Market factoring-in

Market positioning and official FINRA history became small reliability-gated Entry and Exit-review modifiers.

3.3

UI polishing

Mobile-first tables, clearer score maps, navigation, responsive typography, FINRA chart pulse and compact decision views.

3.4

Backtested learning

Time Machine, point-in-time reconstruction, persisted simulations, forward outcomes and per-ticker lessons.

3.5

Position-aware decisions

Owned tickers translate evidence into Add / Hold / Monitor / Trim / Exit; unowned tickers remain initiation decisions.

3.6

FINRA refinement

Watchlist-wide history backfill, point-in-time score rebuilds and explicit current/historical coverage discipline.

3.7

Decision-aware learning

Learning-value gate, smart cutoffs, orthogonality audit, confirmed accuracy, simulation markers and extended-hours awareness.

MODELS

Scoring model lineage

● MVP absolute model

Entry = 50% Technical + 30% Valuation + 20% Risk. Exit review = 60% technical deterioration + 40% risk deterioration.

● Industry-calibrated entry

25% Business quality + 30% Peer value + 20% Technical timing + 15% Risk resilience + 10% Analyst sentiment.

● Positioning modifiers

FINRA / market evidence is reliability-gated and capped: +/-5 Entry points and +/-7 Exit-review points. Missing evidence stays neutral.

● Backtested learning v1-v3

Outcomes became decision-aware; comparable 1M / 3M / 6M returns use 50% / 30% / 20% weights. Provisional evidence stays visible.

● Current: learning v4 orthogonal

Removed duplicated drawdown from Technical and analyst actions from Positioning; MA weights rescaled; all saved cutoffs rebuilt.

● Confirmed-episode rule

Only informative independent episodes with matured 3M outcomes train scores; at least 3 are required; learning impact is capped at +/-5.

● Accuracy interpretation

Diagnostic success and overall ticker accuracy use the same auditable episode selection; accuracy history is charted over time.

NOW

What is live and how to read it

● Decision Dashboard

Separate portfolio actions and watchlist opportunities, accuracy, price moves, horizons, calibration state and market regime.

● Company intelligence

Price/MA + FINRA chart, entry/exit maps, peers/analysts, positioning, learning evidence, diagnostic success and accuracy curve.

● Time Machine

Custom or intelligently suggested dates always require confirmation. Every run records cutoff, rationale, provenance, coverage and model version.

● Data discipline

SQLite caches isolate failures. Fundamentals refresh daily; cohort/FINRA/simulation gaps self-complete in bounded background workers.

● Extended hours

PRE / POST / 24-7 quotes are timestamped and advisory. Official closes remain the only inputs to scores and historical learning.

● Rollback & auditability

Older simulations remain stored, model versions are explicit, and checkpoints include Before Industry Feature and Before Trading.

NON-NEGOTIABLES

Research only - no execution. Missing data never becomes false conviction. Every modifier is bounded, visible and reproducible.
